

Baseline Survey

The M&E consultant will also undertake the baseline survey for the project. This survey will collect information that will aid in project planning as well as to provide baseline values for the M&E framework.

In addition to the regular six monthly monitoring reports, the impact evaluation would be around the end time of the Project completion.

The impact evaluation review would be a comprehensive overall impact assessment including quantitative and qualitative assessment of progress against project development objectives.

Project Management Information System (PMIS). A consultant will develop a computerized Project Management Information System (PMIS) under the guidance of PMU and the M&E consultant. The PMIS will provide interactive user-friendly tools, allowing the collection of inputs from the implementing agencies, producing standard reports, and allowing specialized queries to track all aspects of project progress (including physical and financial progress and project outputs and outcomes) at any time.

The M&E consultant will use the PMIS to generate project indicators and the appropriate reports to facilitate the evaluation of each project component and the project as a whole. Furthermore, for PMU, the PMIS will monitor activities and processes of project management, including procurement and financial components. Finally, PMIS will allow for the use of GIS data, allowing spatial visualization of progress and results.
